

1310nm optical fiber

Overview

A 1310nm optical module lets you move data efficiently through fiber optic communication networks. As part of the O-band (1260–1360 nm), it balances low dispersion, stable performance, and cost efficiency. This makes it widely adopted in data centers, enterprise backbones, and metro access. This article delves into why 850, 1310, and 1550 nm are standard, what less-known regimes and tradeoffs exist, and how an OEM fiber-cable manufacturer can design and test with wavelength considerations built in. Understanding these principles ensures your custom assemblies perform reliably across. Among the different kinds of optical fibers, the 1310nm wavelength has some unique features and uses. Single-mode fibers are fibers with a small core diameter that allow only one mode of light propagation.
