

Cable with wires

AI Overview

A cable with wires is an insulated assembly of one or more conductors designed to carry electrical current safely from a power source to devices or equipment.

Types of Cables

Electrical cables come in various types depending on their application:

- NM-B (Non-Metallic Sheathed Cable): Common in residential wiring, typically copper, with color-coded jackets to indicate wire gauge and purpose ().
- THHN/THWN Wire: Multi-purpose building wire used in conduit and cable trays for commercial or industrial applications, rated for 600 volts and heat-resistant up to 90°C ().
- Coaxial Cable: Used for signal transmission, such as TV or internet connections, with a central conductor and shielding.
- Ethernet Cable: Contains multiple twisted pairs of wires for network communication ().
- UF-B (Underground Feeder Cable): Designed for outdoor or direct burial applications, resistant to moisture and sunlight.

Construction

A typical cable consists of:

- Conductors: Usually copper or aluminum, which carry the electrical current ().
- Insulation: Surrounds each conductor to prevent short circuits and protect against fire or shock.
