

Can a network cabinet house rack servers

Overview

A Network Cabinet, often interchangeably called a server rack, is a physical frame or enclosure designed to house and organize various types of network hardware and accessories. Data center operators use racks and cabinets to house and organize their servers, networking and telecommunications gear and other IT equipment, but while “racks” and “cabinets” are sometimes used interchangeably, there are differences between the two. They protect equipment from dust and accidental contact while supporting proper airflow and cooling. Their main goal is to keep critical hardware stable, safe, and easy to maintain. Each one does a different job in your IT setup. This guide explains everything simply so you can pick the right one for your needs.
