

Company fiber optic cable installation with wireless router

AI Overview

Installing fiber optic internet for a company involves running fiber to your building, setting up an ONT, connecting a fiber-ready router, and optimizing your network for high-speed, reliable performance.

Step 1: Check Fiber Availability

Before installation, confirm that fiber service is available at your business location. Contact your ISP or check their website to verify coverage and determine if any new infrastructure is required. Commercial buildings may require coordination with building management for access to conduits or utility areas.

Step 2: Prepare the Installation Site

- Identify a location for the Optical Network Terminal (ONT) near the fiber entry point.
- Ensure a nearby power source for the ONT and router.
- Clear the area of obstacles to allow technician access.
- For businesses, have IT staff available to assist with network configuration.

Step 3: Fiber Line Installation

Technicians will run the fiber optic cable from the ISP's network to your building. This can be done overhead via utility poles or underground through conduits. For commercial setups, micro-trenching or existing conduits may be used to minimize disruption.
